When the chatbot forgets the condition

> **Policy:** Extensions are usually possible **if the car is not reserved for another customer.**

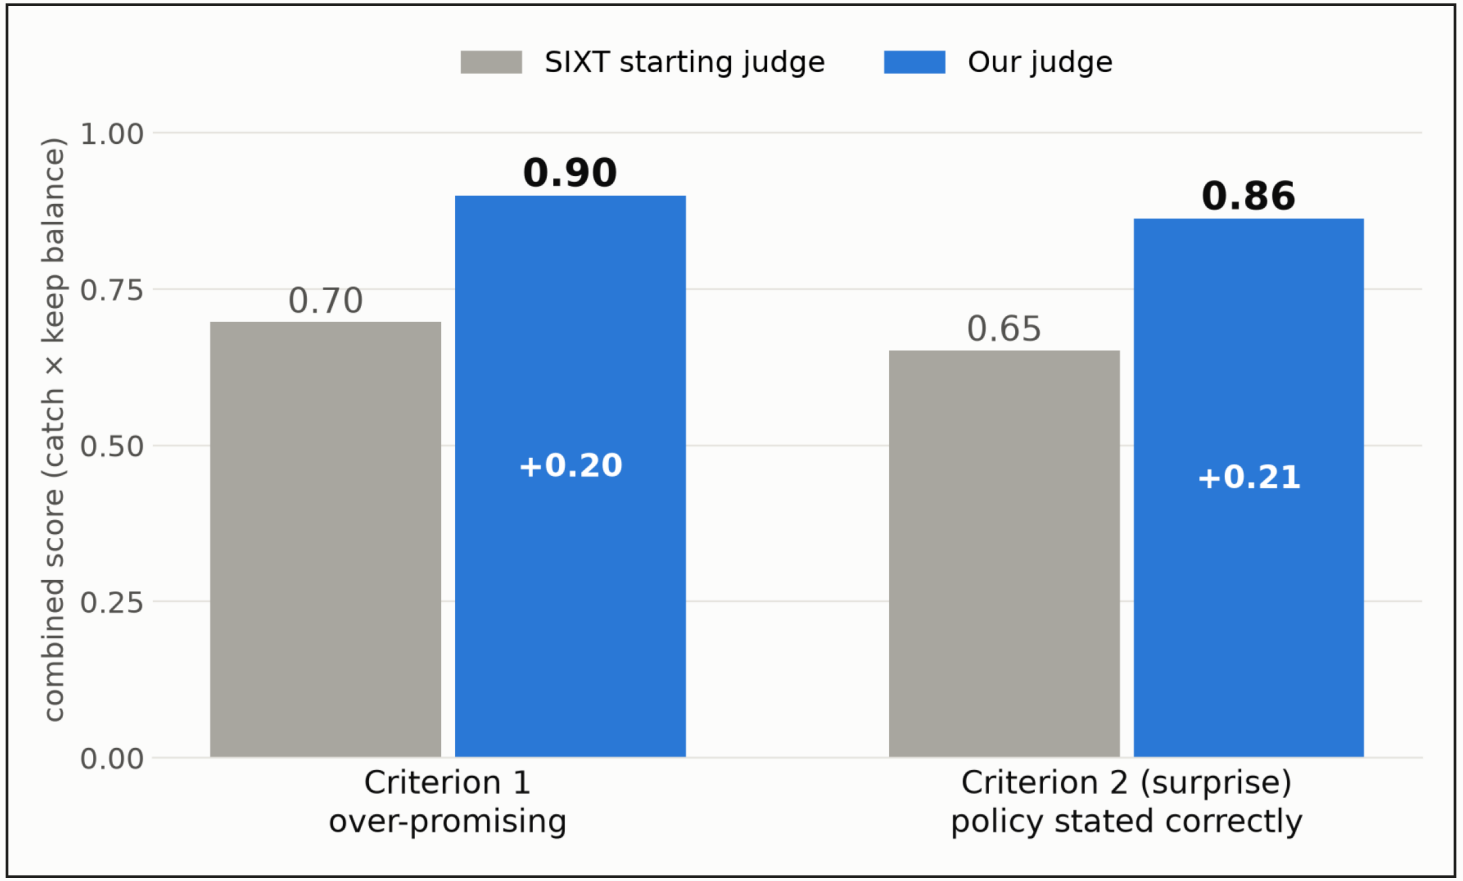

Builds on chain-of-thought (Wei 2022), G-Eval (Liu 2023), FActScore (Min 2023) and self-consistency (Wang 2023).

Also: examples, a number check, two votes

THE RESULT

Clearly better on both criteria

+0.20

Over-promising (criterion 1)

0.70 → 0.90 on 226 practice cases, averaged over runs (0.85–0.92).

+0.21

The surprise criterion

0.65 → 0.86. We got it at 14:30 and didn't touch the code.

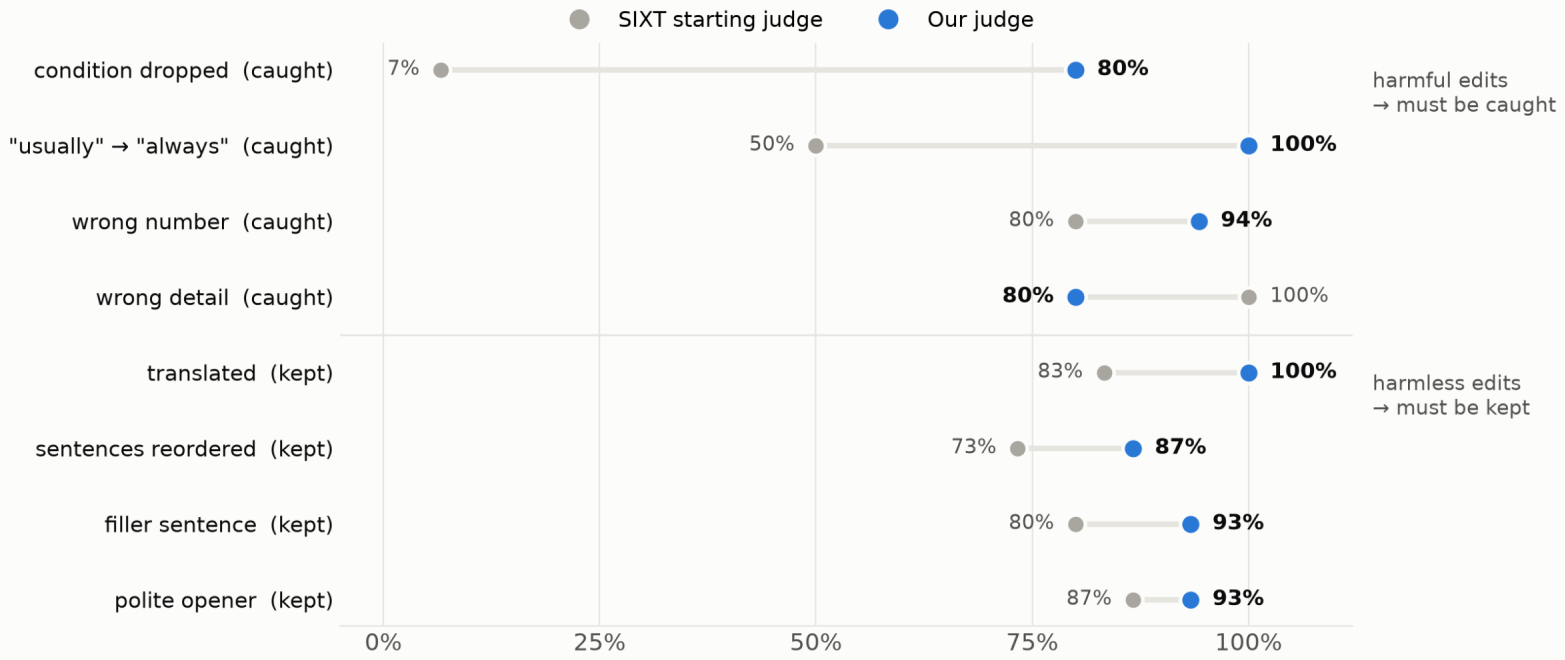

~1 cent

per reply

Two Haiku calls, a few seconds.

WHERE IT CHANGED

Where the gain comes from

Top half: harmful changes that should be caught. Bottom half: harmless changes that should get through, and more of them do now (translated 83% → 100%). One run.

7% → 80%

Dropped conditions caught

The missing half-sentence from slide 1.

50% → 100%

“usually” → “always” caught

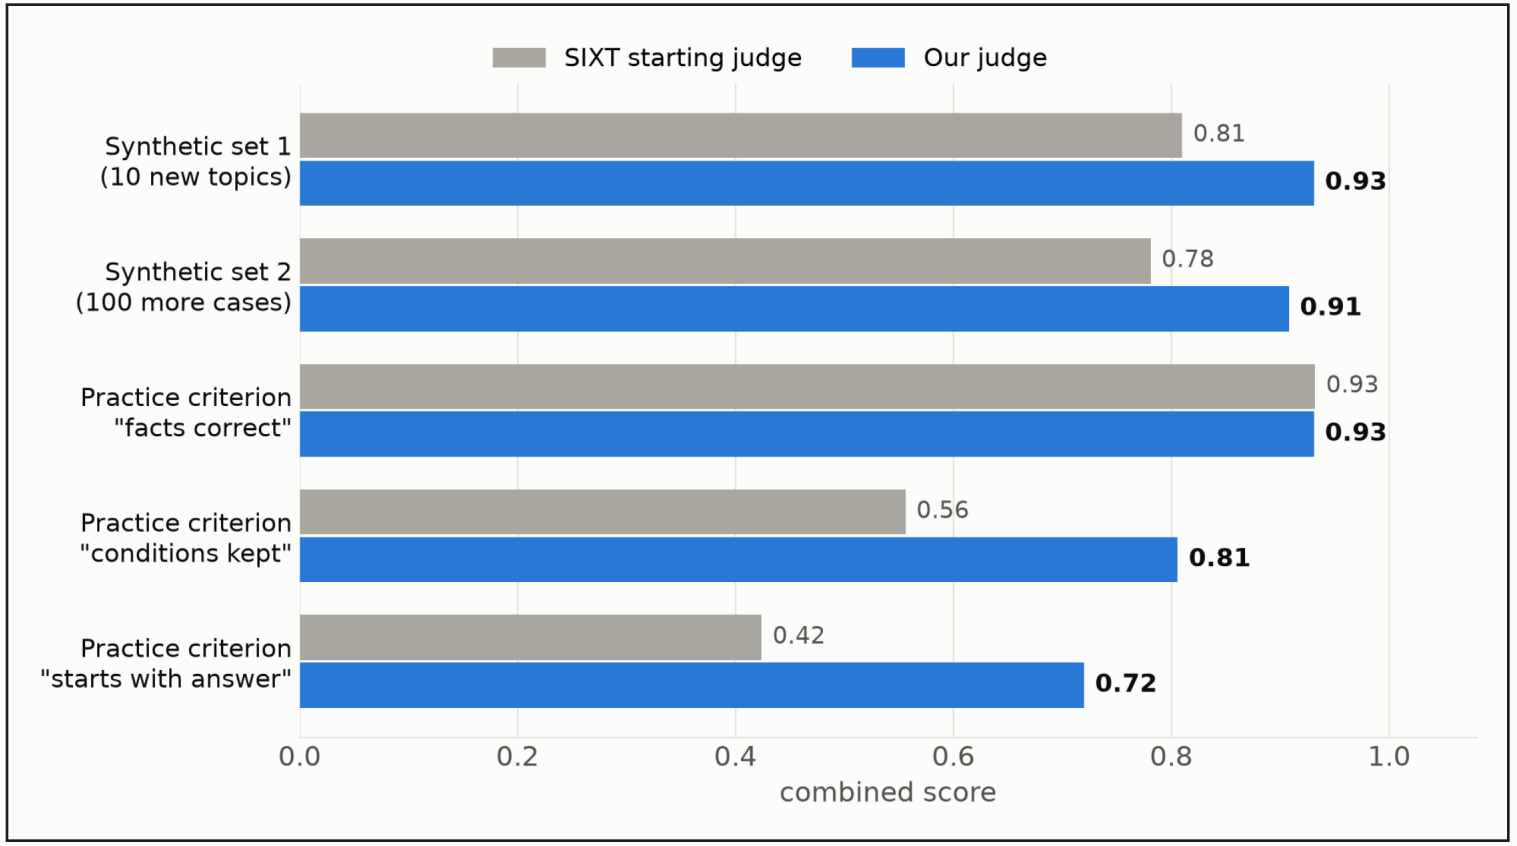

100% → 80%

Wrong details went down

The old judge blocked so much that it caught these anyway.

DOES IT HOLD UP?

Tested on cases it had never seen

0.93 · 0.91

Two synthetic sets

New topics, 100 more cases. The starting judge: 0.81 and 0.78.

0.42 → 0.72

“Starts with answer”

A practice criterion we wrote ourselves; the code ran unchanged.

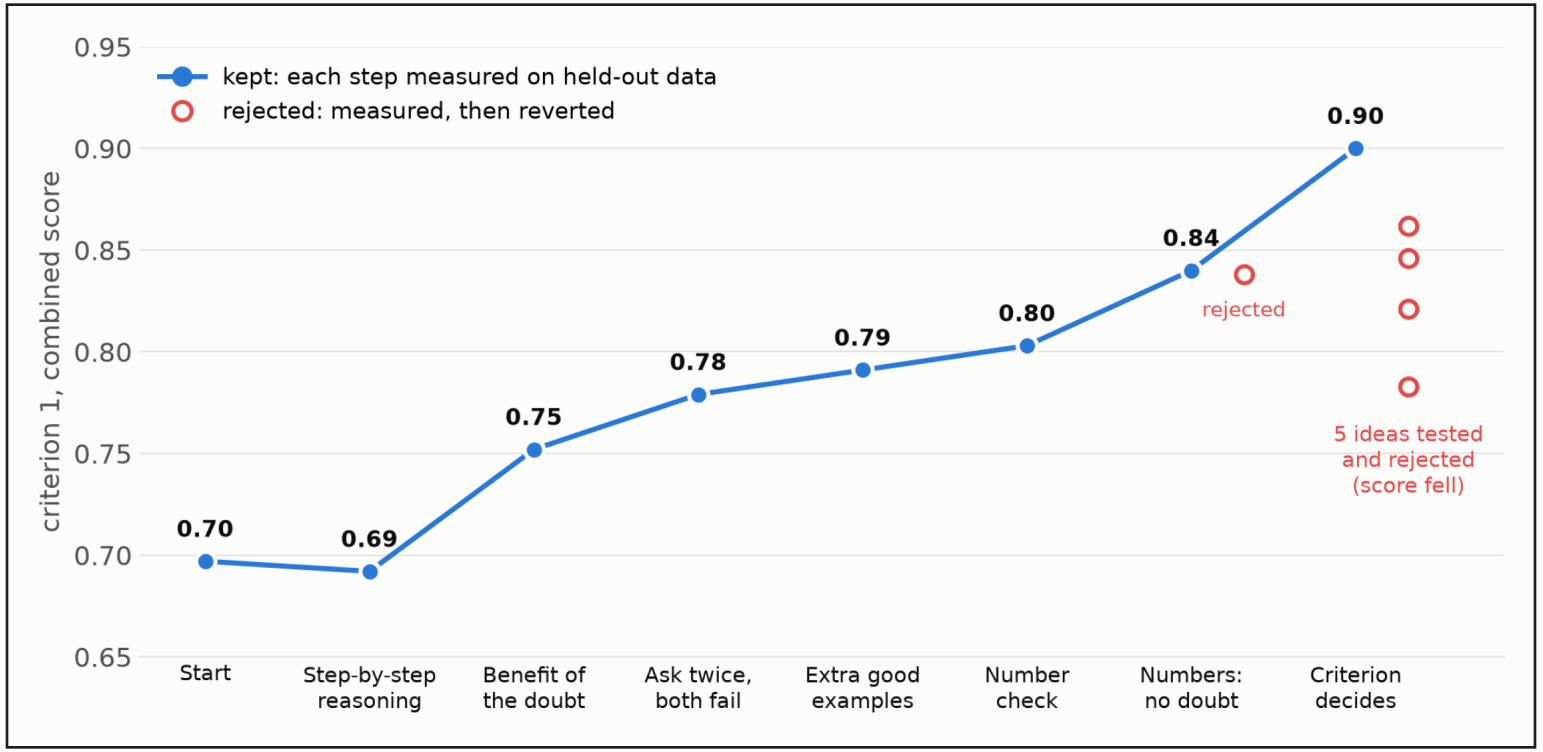

0.93 = 0.93

“Facts correct”: a tie

Here both judges were already good.

HOW WE GOT THERE

From 0.70 to 0.90, one change at a time

0.84 → 0.90

Biggest jump: letting the rule decide

The judge has to quote the part of the rule a difference breaks.

5 ideas

Tested, then dropped

Each one lowered the score, so we took it out.

For SIXT: every reply checked before it goes out, for about a cent.
